Çağrı Çöltekin

University of Tübingen Seminar für Sprachwissenschaft

Summer Semester 2020

Classical NLP pipeline

- Tokenization
- Sentences, (normalized) words, stems / lemmas
- Lexical / morphological processing POS tags, morphological features, stems / lemmas, named entities
- Parsing
- Constituency / dependency trees
- Semantic processing
- word-senses, logical forms Discourse
- Co-reference resolution, discourse representation

Tokenization Segmentation

But, can't we just tokenize based on spaces?

We do not always use a pipeline, not all steps are necessary for all applications

Tokenization Segmentation

· Errors propagate!

Tokenization – a solved problem?

sequence of tokens • Tokens are word-like units

solved task

C. Cöltekin, SfS / University of Tübingen

• Typically, we (in NLP/CL/IR/...) process text as a

• Tokenization is a language dependent task, where it

Tokenization Segmentation

Syntax

• Even for end-to-end approaches, tokenization is often

considered given (needs to be done in advance)

Semantics

Tokenization in the classical NLP pipeline

• Tokenization is the first in the pipeline

becomes more challenging in some languages • Tokenization is often regarded as trivial, and a mostly

• A related task is sentence segmentation

Gets more interesting in other languages

- Chinese: 猫占领了婴儿床 'The cat occupied the crib'
- $German: \ Lebens ver sicher ung sgesells chaft sangestellter$ 'life insurance company employee'
- Turkish: İstanbullulaştıramayabileceklerimizdenmişsiniz 'You were (evidentially) one of those who we may not be able to convert to an Istanbulite'
- · Even more interesting when we need to process 'mixed' text with code-switching

Ç. Çöltekin, SfS / University of Tübingen

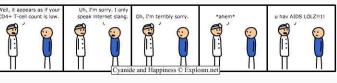

Summer Semester 2020 7 / 21

Ç. Çöltekin, SfS / University of Tübingen

Tokenization Segmentation

Specialized and non-standard text

- More difficult for non-standard text
 - Many specialized terms use a mixture of letters, numbers, punctuation
 - Frequent misspelling, omitting space (e.g., after sentence final punctuation)
- Non-standard text can be
 - Spoken language
 - Old(er) samples of text (e.g., historical records)
 - Specialized domains, e.g., bio-medical texts
 - Informal communication, e.g., social media

Normalization

Normalization is a related task that often interacts with tokenization.

- For most applications (e.g., IR) we want to treat the following the same
 - Linguistics linguistics
 - color colour
 - lower case lowercase lower-case
 - Tübingen Tuebingen Tubingen
 - seee see
 - flm film
 - Different date/time formats, phone numbers
- · Most downstream tasks require the 'normalized' forms of the words

Ç. Çöltekin, SfS / University of Tübingen Summer Semester 2020 C. Cöltekin, SfS / University of Tübingen So, what is a token? One token or multiple? - John's

- New York

German: im (in + dem)

- Turkish:

İstanbullulaştıramayabileceklerimizdenmişsiniz

 $\bullet\,$ Answer is language and application dependent

· Tokenization decisions are often arbitrary

Consistency is important

Ç. Çöltekin, SfS / University of Tübingen

Rule based tokenization Regular expressions and finite-state automata

For example,

· Using regular expressions,

• The 'easy' solution to the tokenization is rule-based

- Numbers too, 123, [A-Z]?[a-z]+[.]?|[0-9]+

• Result is typically imprecise, difficult to maintain

 All alphabetic characters, word, [a-z]+ Capitalization, *John*, [A-Z]?[a-z]+Abbreviations, *Prof.*, [A-Z]?[a-z]+[.]?

- we can define regular expressions for allowed tokens

split after match, disregard/discard the remaining parts

- Numbers with decimal parts [A-Z]?[a-z]+[.]?[0-9.]+

Problems with rule-based approaches

- Rule-based approaches are (still) common in practice,
 - it is difficult to build a rule set that works well in practice
 - it is difficult to maintain
 - it is not domain or language general: needs re-implementation, re-adjustment for every case

Ç. Çöltekin, SfS / University of Tübingen

Tokenization Segmentation

I/O/B tokenization: an example

The U.N. is the largest intergovernmental

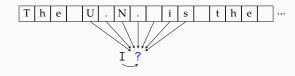

organisation. I had the impression he'll

BIIIIIIIIIIOOBOBIIOBIIOBIIIIIIIIIOBIBIIOBIO

ambassador to the U.N. BIIIIIIIIOBIOBIIOBIIIO

Ç. Çöltekin, SfS / University of Tübingen

Features for tokenization

- · We predict label of each character
- Typical features are the other characters around the target
- · Choice of features and the machine learning method vary
- Using the previous prediction is also useful

Tokenization Segmentation

Splitting sentences

- Another relevant task is sentence tokenization
- For most applications, we need sentence boundaries
- Sentence-final markers, [.!?] are useful
- But the dot '.' is ambiguous: can either be end-of- sentence or abbreviation marker, or both
 - The U.N. is the largest intergovernmental organisation.
 - I had the impression he'll be ambassador to the
- · Again, heuristics along with a list of abbreviations is possible

Ç. Çöltekin, SfS / University of Tübingen

Summer Semester 2020 10 / 21

Tokenization Segmentation

Machine learning for word / sentence tokenization

- · Another approach is to use machine learning
- · Label each character in the text with
 - I inside a token
 - O outside tokens

 - B beginning of a token, alternatively to combine word/sentence tokenization
 - $\ \ \, T\ \, beginning of a token$
 - S beginning of a sentence
- How do we create the training data?
- · What are the features for the ML?

Ç. Çöltekin, SfS / University of Tübingen

Tokenization Segmentation

I/O/B tokenization example

with sentence boundary markers

The U.N. is the largest intergovernmental

organisation. I had the impression he'll be

TIIIIIIIIIIIOOSOTIIOTIIOTIIIIIIIIIIOTITIIOTIO

ambassador to the U.N.

Summer Semester 2020 15 / 21

Tokenization Segmentation Segmentation Supervised segmentation

Tokenization Segmentation

- Segmentation is a related problem in many areas of computational linguistics
 - In some languages, the word boundaries are not marked 猫占领了婴儿床 → 猫 占领 了 婴儿床
 - We often want to split words into their morphemes $Lebens versicherungsgesellschaftsangestellter \rightarrow$ Leben+s+versicherung+s+gesellschaft+s+angestellter
 - In spoken language there are no reliable word boundaries

• I/O/B tokenization is applicable to segmentation as well

- Often produces good accuracy
- The main drawback is the need for labeled data

Tokenization Segmentation

- Some unsupervised methods with reasonable accuracy
- · In some cases, unsupervised methods are useful and favorable

Ç. Çöltekin, SfS / University of Tübingen

Tokenization Segmentation

A simple 'unsupervised' approach

- Using a lexicon, segment at maximum matching lexical
 - Serves as a good baseline, but fails in examples like theman

where maximum match suggests segmentation 'them an'

- The out-of-vocabulary words are problematic
- One can use already known boundaries as signal for supervision
 - Known to work especially well for sentence segmentation, (e.g., using cues .?!)

Summer Semester 2020 18 / 21

Ç. Çöltekin, SfS / University of Tübingen

Ç. Çöltekin, SfS / University of Tübingen

Tokenization Segmentation

Summary

- Tokenization is an important part of an NLP application
- · Tokens are word-like units that are
 - linguistically meaningful
 - useful in NLP applications
- Tokenization is often treated as trivial, has many difficulties of its own
- · White spaces help, but does not solve the tokenization problem completely
- Segmentation is tokenization of input where there are no boundary markers
- Solutions include rule-based (regex) or machine learning approaches

Ç. Çöltekin, SfS / University of Tübingen

Unsupervised segmentation

- Two main approaches
 - Learn a compact lexicon that maximizes the likelihood of the data

$$P(s) = \prod_{i=1}^{n} P(w_i)$$

 $P(w) = \begin{cases} (1-\alpha)f(w) & \text{if } w \text{ is known} \\ \alpha \prod_{i=1}^m P(\alpha_i) & \text{if } w \text{ is unknown} \end{cases}$

- Segment at points where predictability (entropy) is low The general idea: the predictability within words is high, predictability between words is low

Tokenization Segmentation

Next

Wed POS tagging / morphological processing

Ç. Çöltekin, SfS / University of Tübingen

Some extra: modeling segmentation by children NLP can be 'sciency', too

- An interesting application of unsupervised segmentation methods is modeling child language acquisition
- · How children learn languages has been one of the central topics in linguistics and cognitive science
- Computational models allow us to
 - test hypotheses
 - create explicit models
 - make predictions

· No clear boundary markers No lexical knowledge

How do children segment? – a bit of psycholinguistics

Children very early in life (8-months) seem to be sensitive to statistical regularities between syllables (Saffran, Aslin, and Newport 1996)

Training: bidakupadotigolabubidakugolabupadoti... test G2: non-words P(da | bi) = 1 $P(pa \mid bu) = \frac{1}{3}$

Children showed preference towards the 'words' that are used in the training phase.

Ç. Çöltekin, SfS / University of Tübinger

pagolabidotikugobdalaubu...

How to calculate the measures

padotibidakugolabupadoti...

$$P(6|\&t) = 0.03$$

Calculations are done on a corpus of child-directed English

Additional reading, references, credits

- Textbook reference: Jurafsky and Martin (2009, chapter 2 of the 3rd edition draft) sections 2.1–2.3 (inclusive)
- The Chinese word segmentation example is from Ma and Hinrichs (2015)
- Other segmentation examples are from Çöltekin (2011), where there is also a good amount of introductory information on segmentation

Predictability

Predictability within units is high, predictability between units is low.

Given a sequence 1r, where 1 and r are sequences of phonemes:

- If 1 help us predict r, 1r is likely to be part of a word
- If observing r after 1 is surprising it is likely that there is a boundary between 1 and r

The strategy dates back to 1950s (Harris 1955), where he used a measure called successor variety (SV):

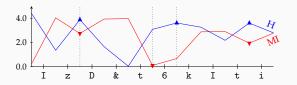

The morpheme boundaries are at the locations where there is a high variety of possible phonemes that follow the initial segment.

Ç. Çöltekin, SfS / University of Tübingen

An unsupervised method

• An obvious way to segment the sequence is using a threshold value. However, the choice of threshold is difficult in an unsupervised system.

A simple unsupervised method: segment at peaks/valleys.
