Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

The biological neuron

(showing a picture of a real neuron is mandatory in every ANN lecture)

Ç. Çöltekin, SfS / University of Tübinge

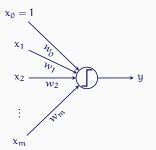

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Recap: the perceptron

$$y = f\left(\sum_{j}^{m} w_{j} x_{j}\right)$$

$$f(x) = \begin{cases} +1 & \text{if} \quad wx > 0 \\ -1 & \text{otherwise} \end{cases}$$

In ANN-speak $f(\cdot)$ is called an $activation\ function.$

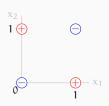

Ç. Çöltekin, SfS / University of Tübingen

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Linear separability

- A classification problem is said to be linearly separable if one can find a linear discriminator
- A well-known counter example is the logical XOR problem

There is no line that can separate positive and negative classes.

Artificial neural networks

- Artificial neural networks (ANNs) are machine learning models inspired by biological neural networks
- ANNs are powerful non-linear models
- Power comes with a price: there are no guarantees of finding the global minimum of the error function
- ANNs have been used in ML, AI, Cognitive science since 1950's - with some ups and downs
- · Currently they are the driving force behind the popular 'deep learning' methods

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Artificial and biological neural networks

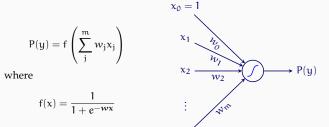

- ANNs are inspired by biological neural networks
- Similar to biological networks, ANNs are made of many simple processing units
- Despite the similarities, there are many differences: ANNs do not mimic biological networks
- ANNs are practical statistical machine learning methods

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Can a linear classifier learn the XOR problem?

• We can use non-linear basis functions

$$w_0 + w_1 x_1 + w_2 x_2 + w_3 \phi(x_1, x_2)$$

is still linear in w for any choice of $\phi(\cdot)$

 $\bullet\,$ For example, adding the product x_1x_2 as an additional feature would allow a solution like: $x_1 + x_2 - 2x_1x_2$

x_1	x_2	$x_1 + x_2 - 2x_1x_2$
0	0	0
0	1	1
1	0	1
1	1	0

 \bullet Choosing proper basis functions like x_1x_2 is called feature engineering

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Where do non-linearities come from?

non-linearities are abundant in nature, it is not only the XOR problem

In a linear model, $y = w_0 + w_1x_1 + \ldots + w_kx_k$

- The outcome is *linearly-related* to the predictors
- The effects of the inputs are additive

This is not always the case:

- Some predictors affect the outcome in a non-linear way
 - The effect may be strong or positive only in a certain range of the variable (e.g., reaction time change by age)
 - Some effects are periodic (e.g., many measures of time)
- Some predictors interact 'not bad' is not 'not' + 'bad' (e.g., for sentiment analysis)

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Artificial neurons

• The unit calculates a weighted sum of the inputs

$$\sum_{j}^{m} w_{j} x_{j} = wx$$

- Result is a linear transformation
- Then the unit applies a non-linear activation function $f(\cdot)$
- Output of the unit is

$$y = f(wx)$$

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Artificial neurons

an example

• A common activation function is the *logistic sigmoid* function

$$f(x) = \frac{1}{1 + e^{-x}}$$

• The output of the network becomes

$$y = \frac{1}{1 + e^{-wx}}$$

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANN

Activation functions in ANNs

hidden units

- $\bullet\,$ The activation functions in MLP are typically continuous (differentiable) functions
- For hidden units common choices are

Sigmoid (logistic)

 $\frac{1}{1+e^{-x}}$

Hyperbolic tangent (tanh)

 $e^{2x}+1$

Rectified linear unit (relu) $\max(0, x)$

Activation functions in ANNs

output units

- The activation functions of the output units depends on the task. Common choices are
 - For regression, the identity function (y = x)
 - For binary classification, logistic sigmoid

$$P(y = 1 \mid x) = \frac{1}{1 + e^{-wx}} = \frac{e^{wx}}{1 + e^{wx}}$$

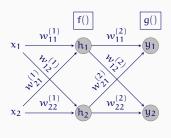

- For multi-class classification, softmax

$$P(y = k \mid x) = \frac{e^{w_k x}}{\sum_j e^{w_j x}}$$

MLP: a simple example

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

MLP: a simple example

· Alternatively, we can write the computations in matrix

$$\mathbf{h} = \mathbf{f}(\mathbf{W}^{(1)}\mathbf{x})$$

$$\begin{aligned} \mathbf{y} &= g(W^{(2)}\mathbf{h}) \\ &= g\left(W^{(2)}f(W^{(1)}\mathbf{x})\right) \end{aligned}$$

• This corresponds to a series of transformations followed by elementwise (non-linear) function applications

function in small (or not so small) steps

direction of the maximum increase

 $\boldsymbol{\eta}$ is the learning rate

• The updates can be performed

batch for the complete training set on-line after every training instance

mini-batch after small fixed-sized batches

· The general idea is to approach a minimum of the error

 $\boldsymbol{w} \leftarrow \boldsymbol{w} - \eta \nabla J(\boldsymbol{w})$

- ∇J is the gradient of the loss function, it points to the

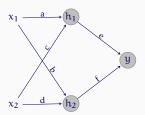

- this is known as *stochastic gradient descent* (SGD)

ion Non-linearity MLP Non-linearity and MLP Learning in ANNs

Gradient descent: a refresher

Non-linear activation functions are necessary

Without non-linear activation functions, an ANN with any number of layers is equivalent to a linear model.

$$h_1 = \alpha x_1 + c x_2 \\$$

$$h_2 = bx_1 + dx_2$$

$$y = eh_1 + fh_2$$

$$= (ea + fb)x_1 + (ec + fd)x_2$$

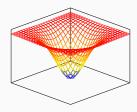

y is still a linear function of x_i

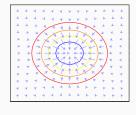

Ç. Çöltekin, SfS / University of Tübingen

Global and local minima

luction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Gradient descent: the picture

$$\nabla f(x_1,\dots,x_n) = \left(\frac{\partial f}{\partial x_1},\dots,\frac{\partial f}{\partial x_n}\right)$$

A function is *convex* if there is only one (global) minimum.

Ç. Çöltekin, SfS / University of Tübinge

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

global min.

w₁

Learning in ANNs

Ç. Çöltekin, SfS / University of Tübing

- ANNs implement complex functions: we need to use optimization methods (e.g., gradient descent) to train them
- Typically error functions for ANNs are not convex, gradient descent will find a local minimum
- Optimization requires updating multiple layers of weights
- Assigning credit (or blame) to each weight during learning is not trivial
- An effective solution to the last problem is the backpropagation algorithm

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Calculating gradient on a neural network (with some simplification)

• We need to calculate the gradient:

E(we)can use gradient descent directly

 $\frac{\partial E}{\partial e}$ and $\frac{\partial E}{\partial f}$ is easy, they do not depend on other variables

• We factor others using chain rule

$$\frac{\partial E}{\partial a} = \frac{\partial h1}{\partial a} \frac{\partial E}{\partial h1}$$
 and $\frac{\partial E}{\partial c} = \frac{\partial h1}{\partial c} \frac{\partial E}{\partial h1}$

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Error functions in ANN training

depend on the task

· For regression, a natural choice is minimizing the sum of squared error

$$E(w) = \sum_{i} (y_i - \hat{y}_i)^2$$

• For binary classification, we use cross entropy

$$E(w) = -\sum_{i} y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i)$$

· Similarly, for multi-class classification, also cross entropy

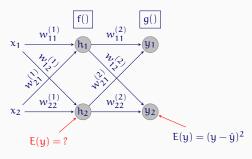

$$E(w) = -\sum_{i} \sum_{k} y_{i,k} \log \hat{y}_{k}$$

In practice, the ANN loss functions will not be convex.

Ç. Çöltekin, SfS / University of Tübingen

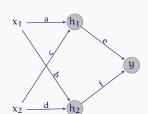

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Learning in multi-layer networks: the problem

We want a way to update non-final weights based on final error.

Backpropagation

· So far, it is just math

$$\frac{\partial E}{\partial \alpha} = \frac{\partial h1}{\partial \alpha} \frac{\partial E}{\partial h1} \quad \text{and} \quad \frac{\partial E}{\partial c} = \frac{\partial h1}{\partial c} \frac{\partial E}{\partial h1}$$

- · But a naive implementation does many repeated calculations
- Backpropagation is an efficient (dynamic programming) algorithm that avoids repeated calculations
- Backpropagation works for any computation graph without cycles

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Preventing overfitting in neural networks

• As in linear models, we can use L1 and L2 regularization by adding a regularization term to the error function (known as weight decay). For example,

$$J(w) = E(w) + \|\boldsymbol{W}\|$$

- · There are other ways to fight overfitting
 - With early stopping, one stops the training before it reaches to the smallest training error
 - With dropout, random units (with all of their connections) are dropped during training
 - Injecting noise at the output, as a way to (implicitly) model the noise in the target classes/values

Ç. Çöltekin, SfS / University of Tübinge

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

How many layers, units

- A network with single hidden layer is said to be a universal approximator: it can approximate any continuous function with arbitrary precision
- · However, in practice multiple interconnected layers are useful and commonly used in modern ANN models
- · The choice of layers, in general the architecture of the system, depends on the application

Ç. Çöltekin, SfS / University of Tübingen

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Summary

- ANNs are powerful non-linear learners
 - based on some inspiration from biological NNs
 - using many simple processing units
 - built on linear models (logistic regression)
- For non-linear problems we need non-linear activation functions, and at least one hidden layer
- ANNs can be used for both regression and classification
- . In general, ANN loss functions are not convex, what we find is a local minimum
- \bullet They (typically) are trained with ${\it backpropagation}$ algorithm Next:

Mon/Wed Unsupervised learning

Stochastic gradient descent

- Standard (batch) gradient descent is computationally expensive: it updates weight at
- Stochastic gradient descent (SGD) updates weights for every training instance
- · SGD may take more steps, but converges to the same solution
 - In practice a mini-batch is more common
 - Correct batch size is not only about efficiency, it also affects

C. Cöltekin, SfS / University of Tübingen

w₁

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

Adapting learning rate

• The choice of learning rate η is important

too small slow convergence

too big $% \left(1\right) =\left(1\right) \left(1\right) \left($ or even jump away

- The idea is to adapt the learning rate during learning
- A common trick is adding a momentum: if we move in the same direction a long time accelerate

$$\Delta w_{ij}(t) = \eta \frac{\partial E}{\partial w_{ij}} + \alpha \Delta w_{ij}(t-1)$$

• There are many adaptive optimization algorithms: Adagrad, Adadelta, RMSprop, Adam, ...

Ç. Çöltekin, SfS / University of Tübinger

Introduction Non-linearity MLP Non-linearity and MLP Learning in ANNs

A bit of history

1950-60 ANNs (perceptron) became popular: lots of excitement in AI, cognitive science

1970s Not much interest

- criticism on perceptron: linear separability

1980s ANNs became popular again

- backpropagation algorithm
- multi-layer networks

1990s ANNs had again fallen 'out of fashion'

- Engineering: other algorithms (such as SVMs) performed generally better
- From the cognitive science perspective: ANNs are difficult to interpret

present ANNs (again) enjoy a renewed popularity with the name 'deep learning'
