Summer Semester 2020

The task

- · Given a set of training data with (categorical) labels
- Train a model to predict future data points from the same distribution

The perceptron

Similar to the *intercept* in linear models, an additional input x_0 which is always set to one is often used (called bias in ANN literature)

Ç. Çöltekin, SfS / University of Tübingen

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evaluation

Learning with perceptron

- We do not update the parameters if classification is correct
- For misclassified examples, we try to minimize

$$E(w) = -\sum_{i} w x_{i} y_{i}$$

where i ranges over all misclassified examples

· Perceptron algorithm updates the weights such that

$$w \leftarrow w - \eta \nabla E(w)$$
$$w \leftarrow w + \eta x_i y_i$$

for misclassified examples. η is the learning rate

When/why do we do classification

- Is a given email spam or not?
- What is the gender of the author of a document?
- Is a product review positive or negative?
- Who is the author of a document?
- What is the subject of an article?

As opposed to regression, the outcome is a 'category'.

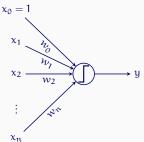

Outline

- Perceptron
- · Logistic regression
- Naive Bayes
- Multi-class strategies for binary classifiers
- Evaluation metrics for classification
- · Brief notes on what we skipped

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evaluation

The perceptron: in plain words

- Sum all input x_i weighted with corresponding weight w_i
- Classify the input using a threshold function

positive the sum is larger than 0 negative otherwise

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evaluation

The perceptron algorithm

- The perceptron algorithm can be online update weights for a single misclassified example batch updates weights for all misclassified examples at once
- The perceptron algorithm converges to the global minimum if the classes are linearly separable
- If the classes are not linearly separable, the perceptron algorithm will not stop
- We do not know whether the classes are linearly separable or not before the algorithm converges
- In practice, one can set a stopping condition, such as
 - Maximum number iterations/updates
 - Number of misclassified examples
 - Number of iterations without improvement

C. Cöltekin, SfS / University of Tübingen Summer Semester 2020 6 / 41 C. Cöltekin, SfS / University of Tübingen

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evalu

Perceptron: a bit of history

- The perceptron was developed in late 1950's and early 1960's (Rosenblatt 1958)
- It caused excitement in many fields including computer science, artificial intelligence, cognitive science
- The excitement (and funding) died away in early 1970's (after the criticism by Minsky and Papert 1969)
- The main issue was the fact that the perceptron algorithm cannot handle problems that are not linearly separable

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evalua

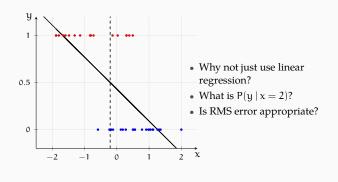

Logistic regression

- Logistic regression is a classification method
- In logistic regression, we fit a model that predicts $P(y \,|\, x)$
- Logistic regression is an extension of linear regression - it is a member of the family of models called generalized
- Typically formulated for binary classification, but it has a natural extension to multiple classes
- The multi-class logistic regression is often called maximum-entropy model (or max-ent) in the NLP literature

Data for logistic regression

an example with a single predictor

Logistic function

Ç. Çöltekin, SfS / University of Tübinş

How to fit a logistic regression model (2)

- Bad news: there is no analytic solution
- Good news: the (negative) log likelihood is a convex
- We can use iterative methods such as gradient descent to find parameters that maximize the (log) likelihood
- · Using gradient descent, we repeat

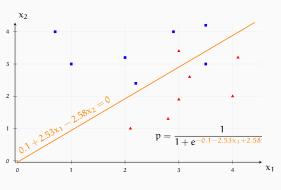

$$\mathbf{w} \leftarrow \mathbf{w} - \eta \nabla E(\mathbf{w})$$

until convergence, η is the *learning rate*

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More

Another example

two predictors

Fixing the outcome: transforming the output variable

- The prediction we are interested in is $\hat{y} = P(y = 1|x)$
- We transform it with logit function:

$$logit(\hat{y}) = log \frac{\hat{y}}{1 - \hat{y}} = w_0 + w_1 x$$

- $\frac{\hat{y}}{1-\hat{y}}$ (odds) is bounded between 0 and ∞
- $\log \frac{\hat{y}}{1-\hat{u}}$ (log odds) is bounded between $-\infty$ and ∞
- we can estimate $logit(\hat{y})$ with regression, transform with the inverse of logit()

$$\hat{y} = \frac{e^{w_0 + w_1 x}}{1 + e^{w_0 + w_1 x}} = \frac{1}{1 + e^{-w_0 - w_1 x}}$$

which is called logistic (sigmoid) function

How to fit a logistic regression model

with maximum-likelihood estimation

$$P(y = 1 | x) = p = \frac{1}{1 + e^{-wx}} \qquad P(y = 0 | x) = 1 - p = \frac{e^{-wx}}{1 + e^{-wx}}$$

The likelihood of the training set is,

$$\mathcal{L}(\boldsymbol{w}) = \prod_{i} p^{y_i} (1 - p)^{1 - y_i}$$

In practice, we maximize \log likelihood, or minimize ' $-\log$

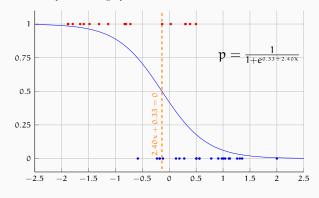

$$-\log \mathcal{L}(\textbf{\textit{w}}) = -\sum_{i} y_{i} \log p + (1-y_{i}) \log (1-p)$$

Multi-class logistic regression

- Generalizing logistic regression to more than two classes is straightforward
- We estimate,

$$P(C_k \mid x) = \frac{e^{w_k x}}{\sum_j e^{w_j x}}$$

where C_k is the k^{th} class, j iterates over all classes.

- The function is called the softmax function, used frequently in neural network models as well
- This model is also known as log-linear model, maximum entropy model, or Boltzmann machine

C. Cöltekin, SfS / University of Tübinger C. Cöltekin, SfS / University of Tübinger

• Given a set of features x, we want to know the class y of

 $\hat{y} = \argmax_{y} P(y \,|\, \textbf{x})$

 $\hat{y} = \operatorname*{arg\,max}_{y} \frac{P(x \,|\, y)P(y)}{P(x)} = \operatorname*{arg\,max}_{y} P(x \,|\, y)P(y)$

· Instead of directly estimating the conditional probability,

• Now the task becomes estimating P(x | y) and P(y)

• The probability distributions $P(x_i | y)$ and P(y) are

binomial e.g, whether a word occurs in the document or not categorical e.g, estimated using relative frequency of words

continuous the data is distributed according to a known distribution

typically estimated using MLE (count and divide)

• A smoothing technique may be used for unknown features

Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evaluation

· Some classification algorithms are non-probabilistic,

· Some classification algorithms are generative: they

estimate the joint distribution p(c,x). Examples: naive Bayes, Hidden Markov Models, (some) neural models

Examples: perceptron, SVMs, decision trees Some classification algorithms are discriminative, probabilistic: they estimate the conditional probability

discriminative: they return a label for a given input.

distribution p(c | x) directly. Examples: logistic regression,

Naive Bayes classifier

- Naive Bayes classifier is a well-known simple classifier
- It was found to be effective on a number tasks, primarily in document classification
- · Popularized by practical spam detection applications
- Naive part comes from a strong independence assumption
- Bayes part comes from use of Bayes' formula for inverting conditional probabilities
- However, learning is (typically) 'not really' Bayesian

Naive Bayes: estimation (cont.)

Naive Bayes: estimation

the object we want to classify

• At prediction time we pick the class, ŷ

we invert it using the Bayes' formula

luction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evalu

Naive Bayes: estimation (cont.)

- Class distribution, P(y), is estimated using the MLE on the
- With many features, $\mathbf{x} = (x_1, x_2, \dots x_n)$, $P(\mathbf{x} \mid \mathbf{y})$ is difficult to estimate
- · Naive Bayes estimator makes a conditional independence assumption: given the class, we assume that the features are independent of each other

$$P(\boldsymbol{x}\,|\,\boldsymbol{y}) = P(\boldsymbol{x}_1, \boldsymbol{x}_2, \dots \boldsymbol{x}_n\,|\,\boldsymbol{y}) = \prod_{i=1}^n P(\boldsymbol{x}_i\,|\,\boldsymbol{y})$$

now	2/3	0
lose	1/3	0
weight	1/3	0
good	0	1/2

P(S) = 3/5, P(NS) = 2/5

More than two classes

· Some algorithms can naturally be extended to handle multiple class labels

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Ev

• Any binary classifier can be turned into a k-way classifier by

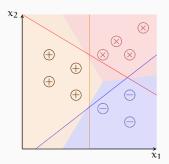

OvR one-vs-rest or one-vs-all

- train k classifiers: each learns to discriminate one of the classes from the others
- · at prediction time the classifier with the highest confidence wins
- · needs confidence score from the base classifiers

OvO one-vs-one

- train $\frac{k(k-1)}{2}$ classifiers: each learns to discriminate a pair of classes
- decision is made by (weighted) majority vote
- works without need for confidence scores, but needs more classifiers

One vs. Rest

- For 3 classes, we fit 3 classifiers separating one class from the rest
- Some regions of the feature space will be ambiguous
- We can assign labels based on probability or weight value, if classifier returns
- One-vs.-one and majority voting is another option

More classification methods ...

- Classification is a well-studied topic in ML, with a large range of applications
- There are many different approaches
- In most cases you can 'plug' a classification algorithm instead of another, treating classifiers as 'black boxes'
- You should, however, understand the methods you use: you may not be able to use them properly if you do not understand them
- One-slide introduction to some of the methods we did not cover starts on the next slide
- We will return to some specialized methods later in this course

Measuring success in classification Accuracy

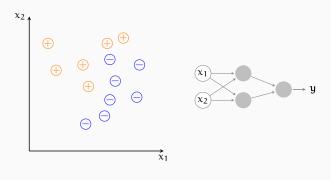

- In classification, we do not care (much) about the average of the error function
- We are interested in how many of our predictions are correct
- · Accuracy measures this directly

 $accuracy = \frac{number\ of\ correct\ predictions}{total\ number\ of\ predictions}$

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evaluation

A quick survey of some solutions

Artificial neural networks

Ç. Çöltekin, SfS / University of Tübinge

Summer Semester 2020

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evaluation

Accuracy may go wrong

- Think about a 'dummy' search engine that always returns an empty document set (no results found)
- If we have
 - 1000 000 documents
 - $\,-\,$ 1000 relevant documents (related to the terms in the query) the accuracy is:

$$\frac{999\,000}{1\,000\,000} = 99.90\,\%$$

• In general, if our class distribution is *skewed*, of *imbalanced*, accuracy will be a bad indicator of success

Ç. Çöltekin, SfS / University of Tübingen Summer Semester 2020 32 / 41 Ç. Çöltekin, SfS / University of Tübingen Summer

 $\frac{300}{1\,000\,000} = 99.90\,\%$ 999 000

1 000 000

Example: back to the 'dummy' search engine

Measuring success in classification

Precision, recall, F-score

$$\begin{aligned} precision &= \frac{TP}{TP + FP} \\ recall &= \frac{TP}{TP + FN} \\ F_{1}\text{-score} &= \frac{2 \times precision \times recall}{precision + recall} \end{aligned}$$

		true value		
ą		positive	negative	
redicted	pos.	TP	FP	
pre	neg.	FN	TN	

• For a query

- 1000 000 documents 1000 relevant documents

accuracy =

Precision and recall are asymmetric, the choice of the 'positive' class is important.

Classifier evaluation: another example

Consider the following two classifiers:

	true value		true value		
ğ		positive	negative	positive	negative
predicted	pos.	7	9	1	3
	neg.	3	1	9	7

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods Evaluation

Accuracy both
$$8/20 = 0.4$$

Precision $7/16 = 0.44$ and $1/4 = 0.25$
Recall $7/10 = 0.7$ and $1/10 = 0.1$
F-score 0.54 and 0.14

Ç. Çöltekin, SfS / University of Tübingen

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods **Evaluation**

Confusion matrix

· A confusion matrix is often useful for multi-class classification tasks

		true class			
		negative	neutral	positive	
icted	negative	10	3	4	
dic	negative neutral	2	12	8	
pre	positive	0	7	7	

- Are the classes balanced?
- · What is the accuracy?
- What is per-class, and averaged precision/recall?

Introduction Perceptron Logistic Regression Naive Bayes Multi-class strategies More methods **Evaluation**

Performance metrics a summary

- · Accuracy does not reflect the classifier performance when class distribution is skewed
- Precision and recall are binary and asymmetric
- For multi-class problems, calculating accuracy is straightforward, but others measures need averaging
- These are just the most common measures, there are more
- · You should understand what these metrics measure, and use/report the metric that is useful for the purpose

Multi-class evaluation

- · For multi-class problems, it is common to report average precision/recall/f-score
- For C classes, averaging can be done two ways:

$$precision_{M} = \frac{\sum_{i}^{C} \frac{TP_{i}}{TP_{i} + FP_{i}}}{C} \qquad recall_{M} = \frac{\sum_{i}^{C} \frac{TP_{i}}{TP_{i} + FN_{i}}}{C}$$

$$precision_{\mu} = \frac{\sum_{i}^{C} TP_{i}}{\sum_{i}^{C} TP_{i} + FP_{i}} \qquad recall_{\mu} = \frac{\sum_{i}^{C} TP_{i}}{\sum_{i}^{C} TP_{i} + FN_{i}}$$

 $(M = macro, \mu = micro)$

The averaging can also be useful for binary classification, if there is no natural positive class

on Logistic Regression Naive Bayes Multi-class strategies More methods **Evaluation**

Precision-recall trade-off

- Increasing precision (e.g., by changing a hyperparameter) results in decreasing recall
- Precision–recall graphs are useful for picking the correct models
- Area under the curve (AUC) is another indication of success of a classifier

Ç. Çöltekin, SfS / University of Tübinger

Summary

- We discussed three basic classification techniques: perceptron, logistic regression, naive Bayes
- We left out many others: SVMs, decision trees, ...
- · We also did not discuss a few other interesting cases, including multi-label classification
- We will discuss some (non-linear) classification methods next
